PARADITI CORP

Digital Shield v2.0

Risk-First Integrity. Fixing the $4B Digital Fraud Epidemic.

UPI and instant payment networks process transactions in milliseconds — but fraud detection remains reactive. We intercept threats **before authorization**, at the network edge.

Vision: To become the default trust layer for global instant payment networks.

Pitch Deck

Seed Round 2025

THE PROBLEM

The Instant Payment Vulnerability

UPI and digital networks are architected for speed — but fraud detection is a post-transaction afterthought. By the time an alert fires, capital is gone and liability is irreversible.

Reactive, Not Preventive

UPI and digital networks process payments instantly, but fraud detection is reactive — operating post-transaction, after capital has already moved and cannot be recalled.

The $4.2B Annual Hemorrhage

$4.2 Billion lost annually to digital payment fraud, mismatched beneficiaries, and synthetic node creation across global instant payment infrastructure.

Regulatory & Capital Exposure

Banks face massive regulatory fines and consumer protection mandates. The absence of real-time nodal reputation mapping leaves institutional gateways structurally exposed.

Irreversible Consumer Harm

Consumers suffer permanent capital loss — with no recourse mechanism once a fraudulent transaction clears a compromised node in the payment network.

THE SOLUTION

Zero-Trust Identity at the Network Edge

A deterministic, real-time security OS that intercepts every transaction **before** authorization — eliminating fraud at the source rather than chasing it after the fact.

14ms

UBS Engine Latency

The Universal Beneficiary Score analyzes multi-nodal transaction histories in under 14 milliseconds — invisible to the user, lethal to bad actors

8

Core Patents

Defensible, institutional-grade IP moat covering behavioral mapping, edge-network artifact analysis, and immutable forensic logging

0

Post-Facto Alerts

Fraudulent nodes are neutralized dynamically — before they interact with institutional gateways, not after capital has moved

100%

Trusted Ledgers Only

Only verified, reputation-mapped nodes are permitted to interact with Tier-1 banking gateways under the Digital Shield protocol

---

Our UBS Engine doesn't flag fraud — it prevents it. By scoring every beneficiary node in real-time before settlement, Digital Shield v2.0 eliminates the attack surface entirely.

TECHNICAL MOAT

The 8-Core Patents — Defensible, Institutional-Grade Tech

PC-01 · UBS Protocol

Proprietary behavioral mapping of financial entities. Scores every beneficiary node across multi-dimensional transaction history before any settlement is authorized.

PC-03 · IDO Verification

Automated edge-network artifact analysis. Identifies synthetic node creation and spoofed identity objects at the point of transaction initiation.

PC-05 · Forensic IP-AUDIT

Immutable logging for legal non-repudiation and automated governmental compliance. Self-healing via RAG — practically irreplicable by legacy KYC providers.

MARKET OPPORTUNITY

Massive, Expanding Addressable Markets

Digital Shield v2.0 targets four distinct, high-value market segments — from consumer safety to sovereign-grade government cyber intelligence contracts.

₹1,200...

B2C Safety Premium

Freemium SaaS TAM for individual digital payment protection — a direct-to-consumer trust layer

₹2,500...

Institutional API

Whitelabeling UBS Engine for Tier-1 Banks — high-margin API licensing at institutional scale

₹850Cr

RAG SaaS

Self-healing enterprise automated legal processing — recurring revenue from compliance automation

₹15,00...

Govt Cyber Intel

G-Cloud Defense Contracts — high-barrier, long-term state-level geospatial threat mapping

---

Investors scale alongside us as we move from B2C safety subscriptions through institutional API licensing to sovereign-grade government cyber intelligence infrastructure — a full-stack trust monopoly.

BUSINESS MODEL

Sustainable, Diversified Revenue

1

Direct-to-Consumer

₹49–₹99/month for premium digital safety umbrellas — a freemium funnel converting individual users into a data-rich trust network that powers the institutional layer.

2

B2B Tiered SaaS

High-margin API licensing of the UBS Engine to Tier-1 Banks and payment processors — **reducing bank mismatches by 25% YoY** with measurable, contractually guaranteed outcomes.

3

Government Contracts

- High-barrier, long-term state-level geospatial threat mapping
- G-Cloud infrastructure integration for sovereign cyber defense
- Current Trajectory: Projecting **280% CAGR through 2026** as the network trust monopolizes data

PRODUCT & TRACTION

A Fully Operational Full-Stack Platform

Digital Shield v2.0 is not a prototype — it is a live, deployed security OS with measurable real-world performance across millions of nodal points.

Live Network Scale

Currently securing over **14.4M+ Nodal Points** — actively mapping beneficiary reputation across live payment infrastructure

Scalable Architecture

Full transition to a scalable **Node.js / React architecture** complete — Android Capacitor wrapper ready for Play Store launch

Sub-14ms Latency

Consistently hitting **10–14ms latency** on IDO Verification — imperceptible to end users, operating entirely at the pre-authorization layer

Institutional-Ready

API infrastructure designed for Tier-1 banking integration — whitelabel-ready UBS Engine with full compliance logging baked in

THE TEAM

Architects of Integrity

We are aggressive, product-obsessed engineers combining deep financial technical knowledge with state-of-the-art UI/UX and algorithmic precision.

Full-Stack OS Builders

Built and scaled the entire P Λ R Λ D I T I Full-Stack OS in rapid development cycles — demonstrating outsized shipping velocity from zero to 14.4M+ secured nodes.

Algorithmic Precision

Deep expertise in deterministic behavioral mapping, RAG-based self-healing systems, and edge-network security — the technical foundation of our 8-core patent portfolio.

Financial-Grade Rigor

Domain expertise spanning institutional banking infrastructure, regulatory compliance frameworks, and government-grade cyber intelligence requirements.

THE ASK

Accelerating the Trust Monopoly

$3.5M Seed Round — Financial Roadmap

01

60% — Network Infrastructure & Core Engineering: Scaling the UBS Engine to handle institutional transaction volumes — expanding beyond 14.4M nodal points toward full Tier-1 banking coverage.

02

25% — Institutional Banking Integrations & API Deployment: Executing commercial agreements with Tier-1 Indian banks and deploying the whitelabel UBS API across their payment gateway infrastructure.

03

15% — IP Defense & Global Patent Finalization: Completing and defending all 8 core patent filings — securing the legal moat that makes Digital Shield v2.0 institutionally irreplicable. **Next Milestone: 80% coverage across Tier-1 Indian banking infrastructure by Q3 2026.**
